

South-Eastern Europe: Impacts from the crisis, vulnerabilities and adjustments

Dimitar Bogov

Governor

Helsinki, November 2012

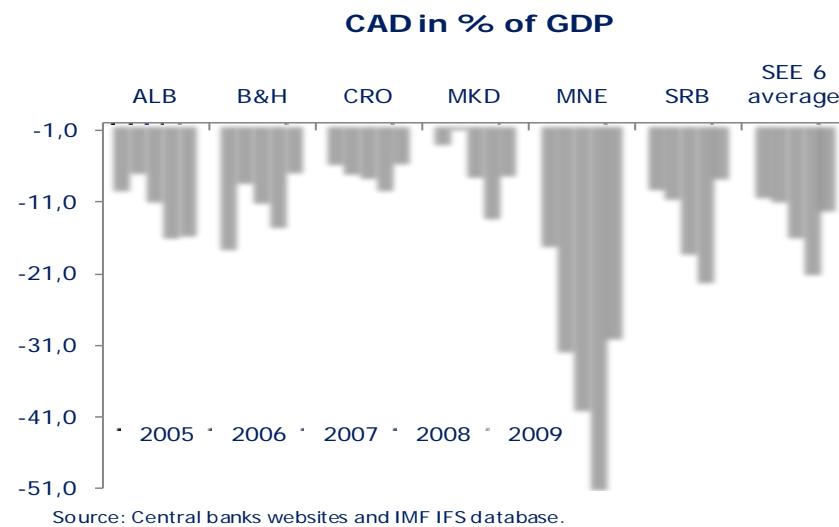

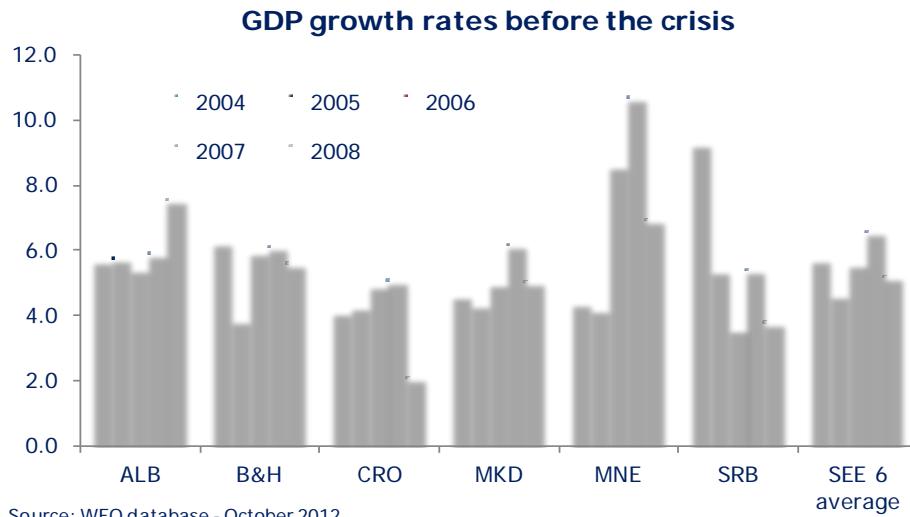

Content:

- **Focus on the SEE-6** (Macedonia, Albania, Bosnia and Herzegovina, Croatia, Montenegro, Serbia);
- **Initial conditions in the region before the crisis;**
- **The impacts from the crisis over the region;**
 - **Macedonian economy in the regional framework;**
 - **Looking ahead: possible adjustments and growth enhancement.**

The main commonalities of SEE countries before the crisis

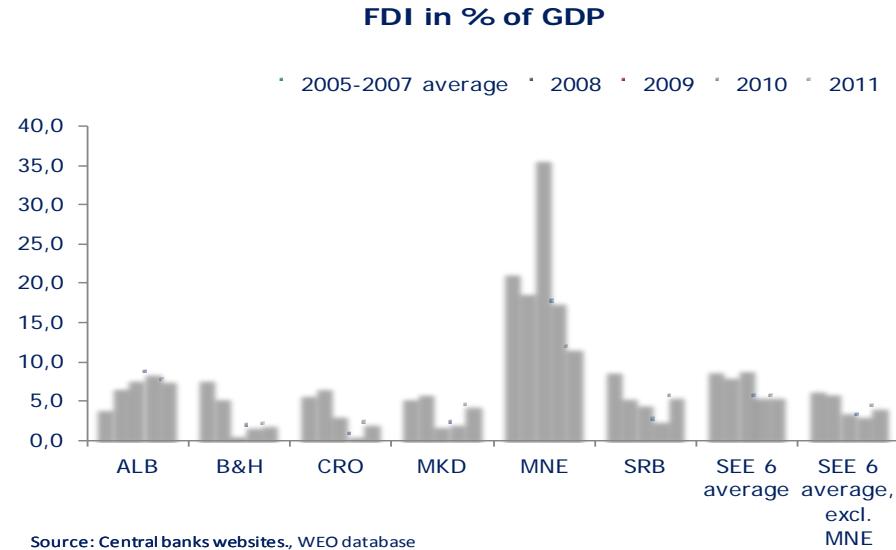

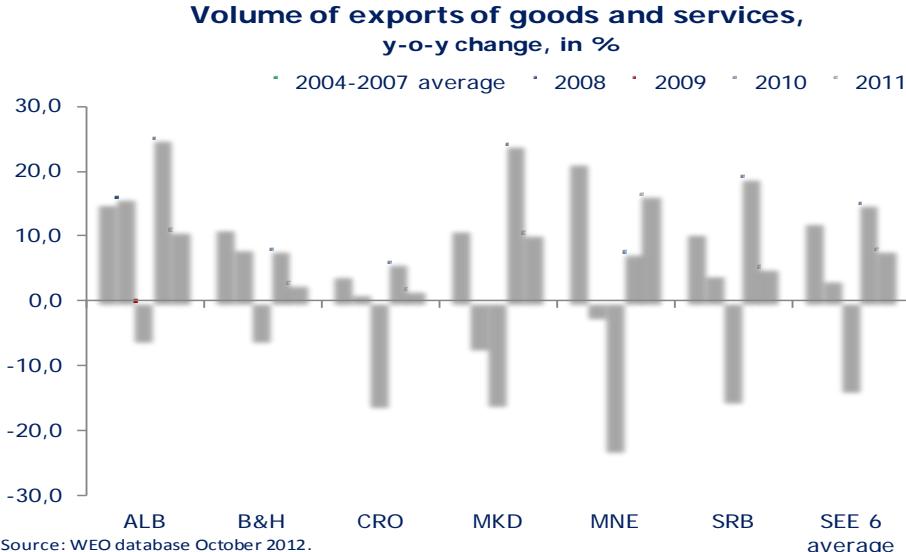

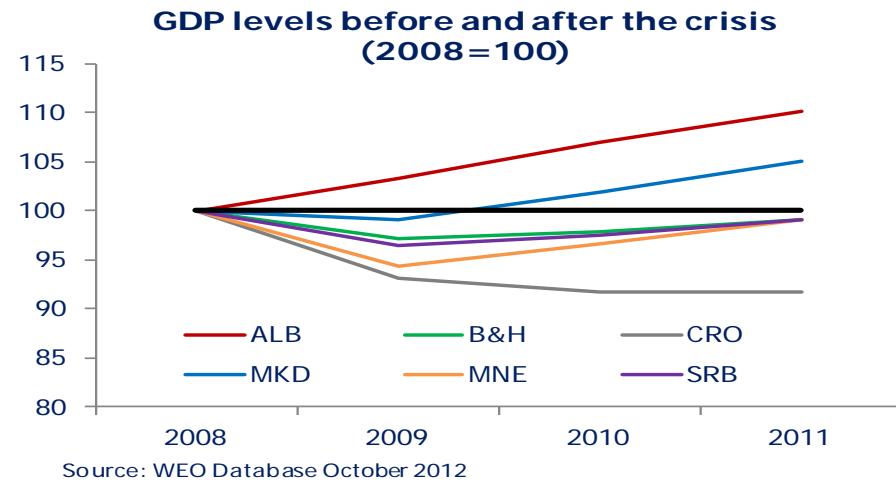

- **Growth accelerated sharply in SEE-6 countries before the crisis**, mostly driven by domestic demand, supported by the rapid credit growth and rising capital inflows;
- **Accumulation of external vulnerabilities at varying degrees**: widening current account deficits and growing external indebtedness in some of the countries;
- **In general, sound financial system**: well-capitalized and liquid banks, though rising reliance on external financing in some countries.

The impacts from the crisis: sharp reversal in economic trends

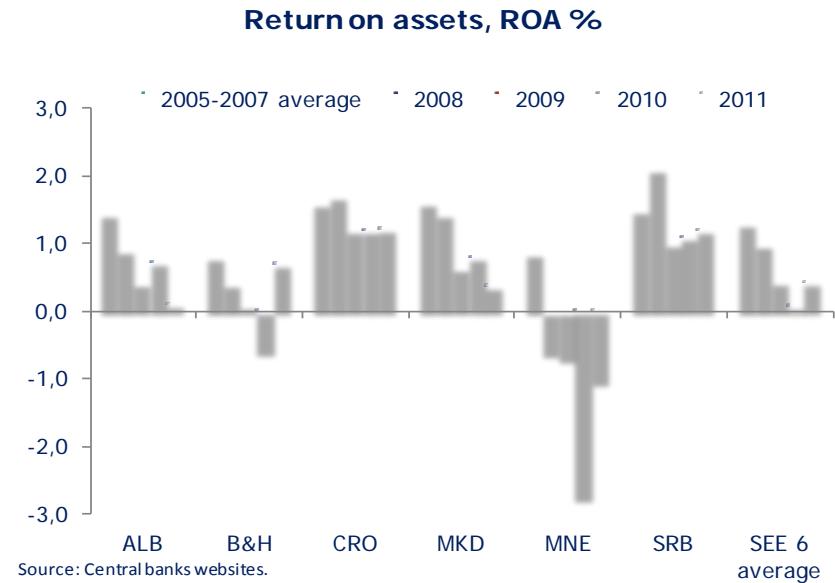

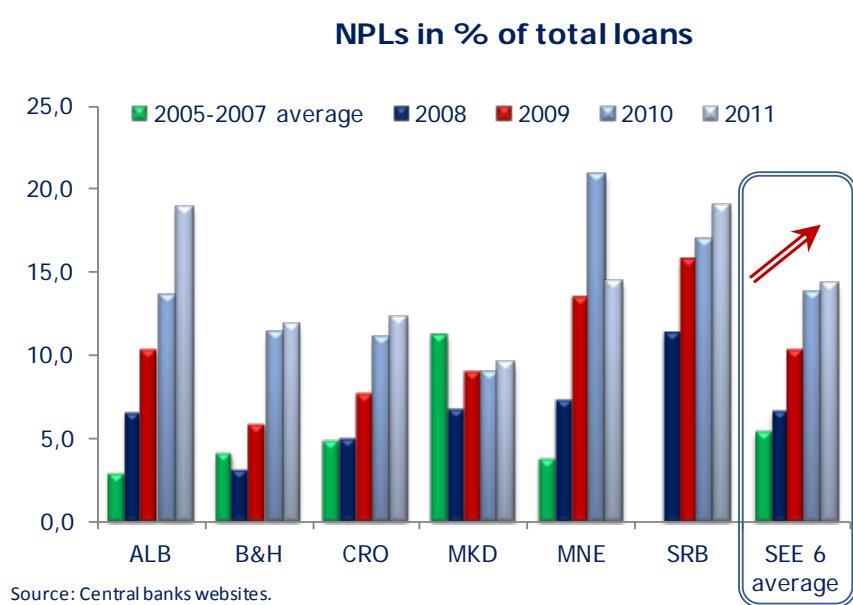

- Crisis spillover effects mainly due to strong trade linkages
- Massive fall in exports, mainly due to reduced external demand, and lower capital inflows undermined the pre-crisis growth model

Increased credit risk and eroded profitability of the banking systems

- Sound initial conditions, traditional banking operations and low exposure to riskier financial instruments contained direct spillovers during the early stage of the crisis

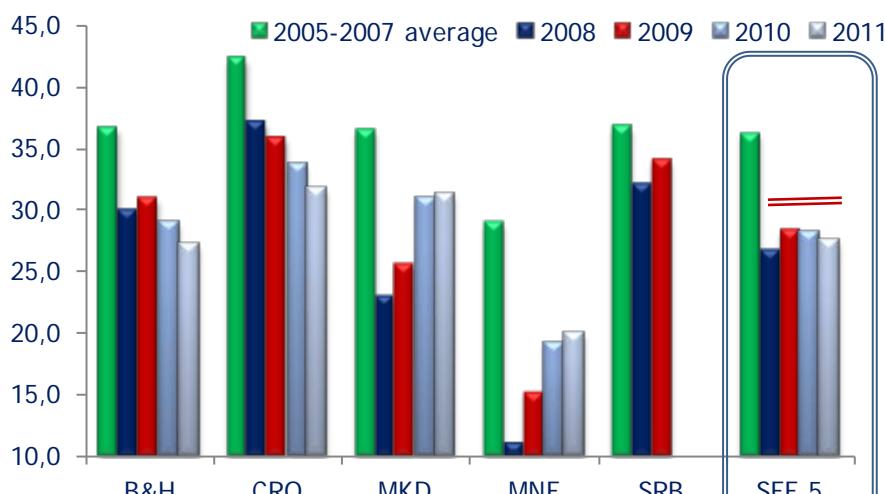

- Considerable second-round effects as the worsened economic outlook pushed credit markets into bust cycle and triggered a rise in NPLs
- In the midstream of the crisis profitability eroded

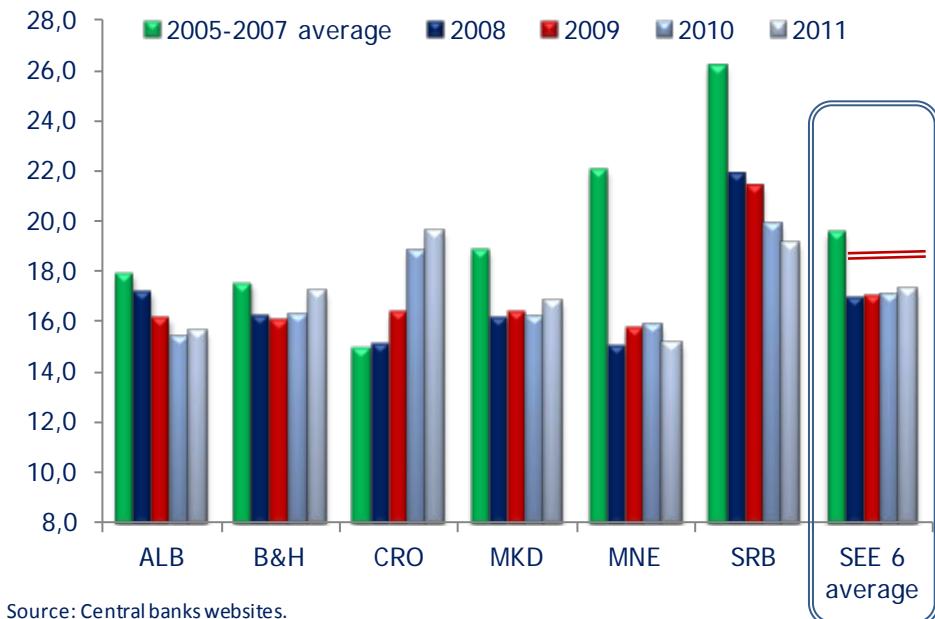

Overall, the financial stability was not under threat

Liquidity ratio, liquid assets to total assets
in %

- Sound capitalization levels strongly contributed to banking sector's resilience
- Stable liquidity ratios of the banking systems

Public finances under pressure contributing to external vulnerabilities build-up

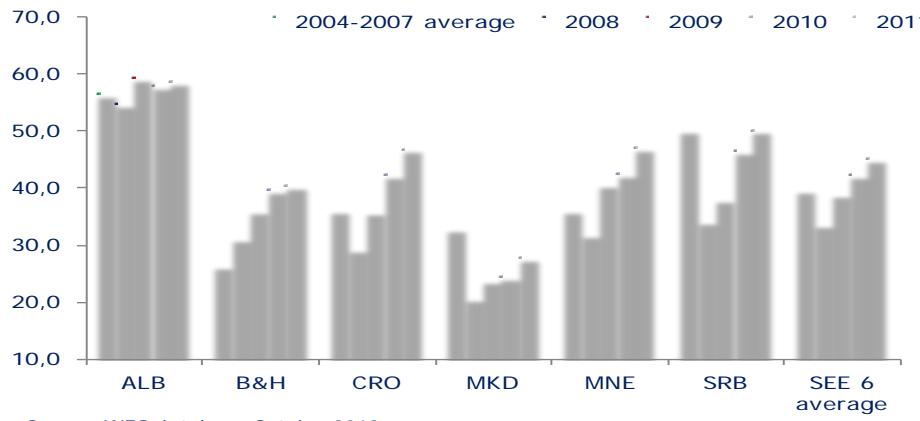

Fiscal balance (% of GDP)

Source: WEO database - October 2012

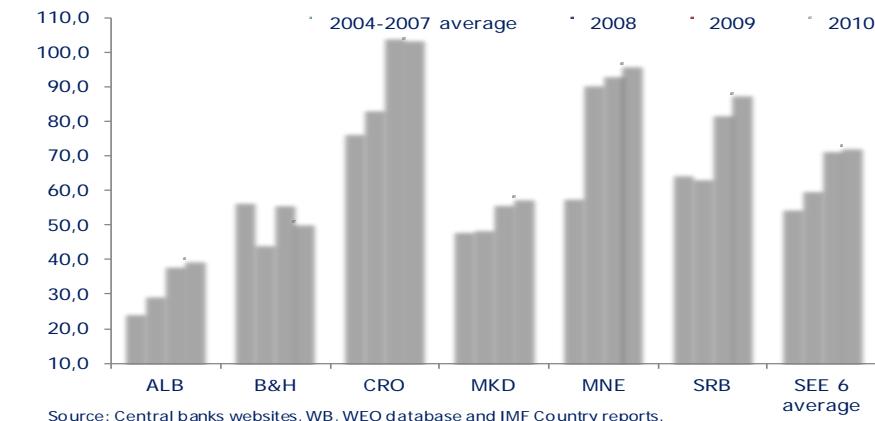

- **Larger public deficits** – automatic stabilizers' effect and counter-cyclical expansionary spending
- **External debt on a rising track**, partly due to governments' increased accumulation of foreign debt

Gross public debt (% of GDP)

Monetary Policy Response

- Stronger countercyclical responses only in the countries with floating exchange rate, where a currency depreciation was allowed in order to mitigate the impact of the crisis
- Conventional and unconventional measures undertaken, balancing between the need for mitigating the crisis impact and maintaining stable currency
- Interventions on the forex market, while bolstering foreign reserves level with external financing (IMF support to part of the region)

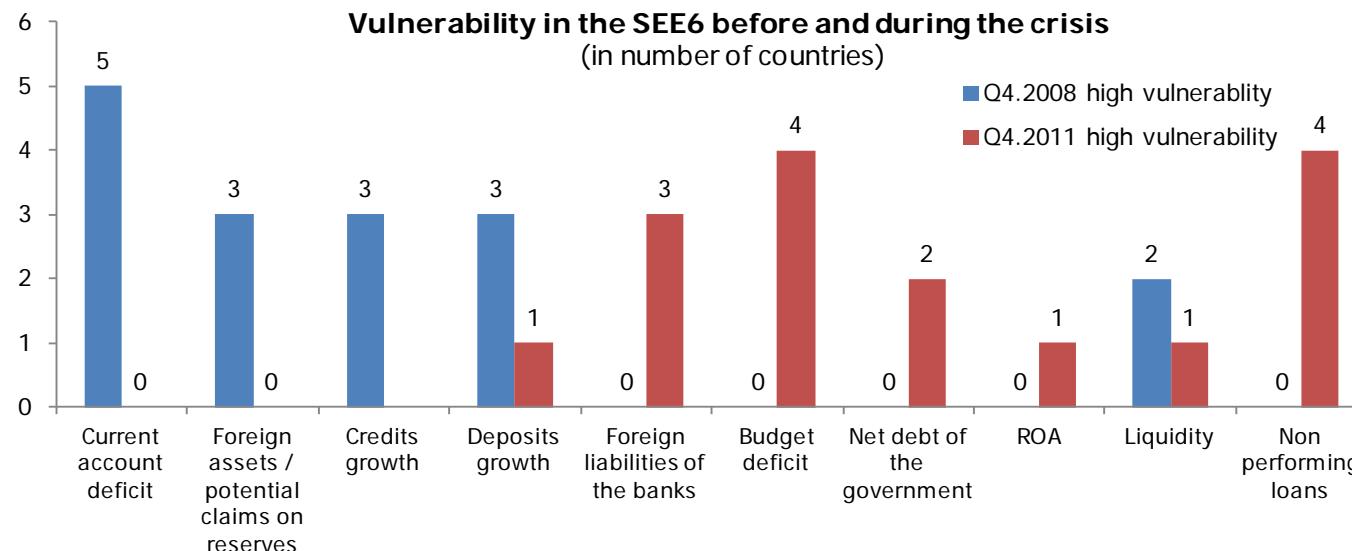

Source: Central banks websites.

Vulnerabilities in the SEE-6 before and during the crisis

- ❑ Vulnerability analysis* of the NBRM pointed out the external sector, strong credit growth and slowdown of deposits growth (first round impact of the crisis) as main vulnerabilities areas before the crisis;
- ❑ During the crisis vulnerabilities moved to the government sector, non performing loans and sources of financing of the banking sector.

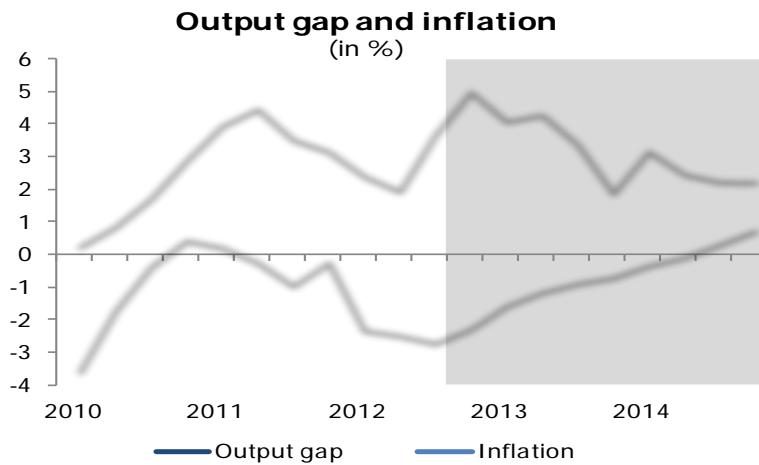

Source: Analysis of the NBRM .

*Analysis is based on historical data, where thresholds are based on the data variability and deviation from the historical mean value.

Macedonian economy within the framework of the regional profile

- Decline in GDP in 2009 (by 0.9%), followed by moderate recovery in the next two years, with positive effects from the FDI inflows before the crisis;
- Inflation mainly driven by the supply side factors, that enabled monetary policy relaxation during the crisis;
- Smaller trade deficit, strong private transfers inflows and without sudden stop in the FDI, which combined with the borrowings from abroad resulted with an increase in the foreign reserves;
- Moderate credit growth, mild deterioration of the assets quality, improved liquidity, strong capital adequacy and lower profitability of the banking sector;
- Higher budget deficit and gradual increase in the public debt.

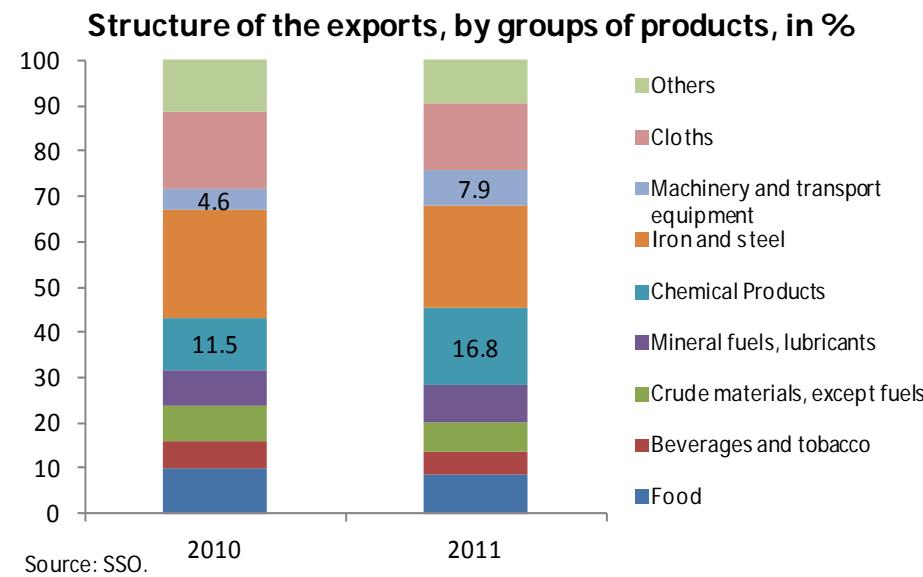

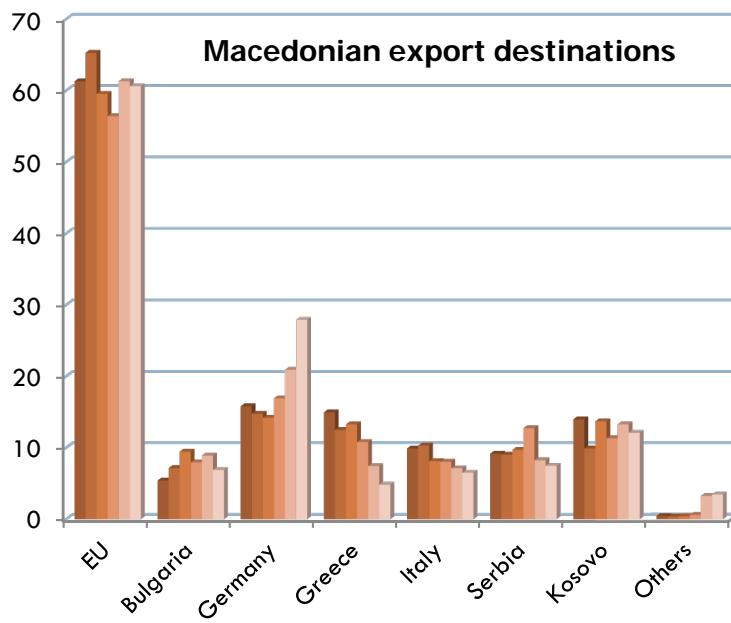

Main risks and challenges (in general, common for the region):

- growth enhancement;
- keeping sound public finance;
- taking care on the level of the external debt;
- stimulating credit growth, while maintaining banking sector soundness.

Macedonian economy – some country specific issues

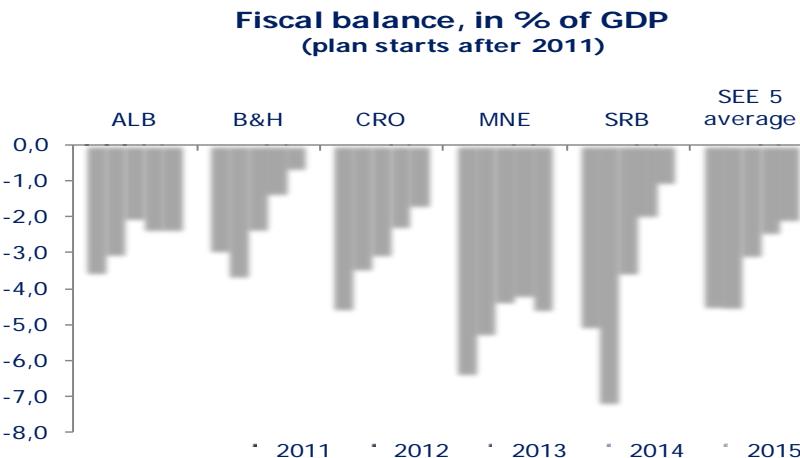

- New export destinations and more diversified export structure, reflecting higher flexibility and some structural improvements, with positive countercyclical effect

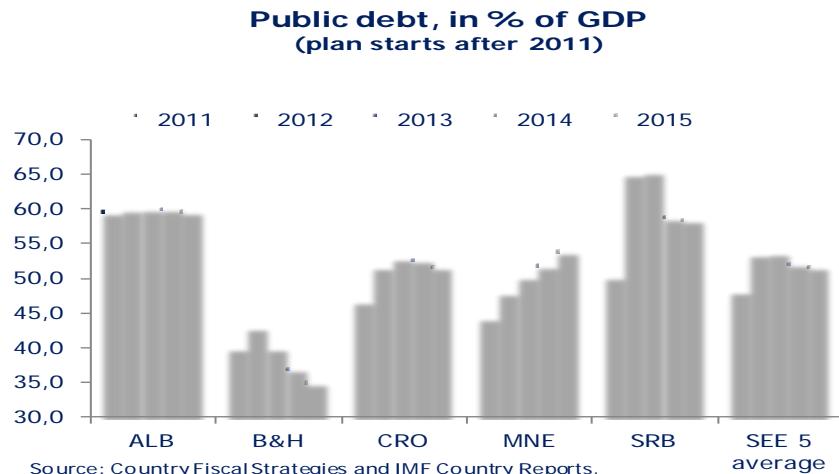

Looking ahead: A need for growth-enhancing model, but limited space for policy maneuver?

- The room for growth-oriented macro-policies is rather limited
- Fiscal consolidation – inevitable for medium-term fiscal sustainability
- Pro-cyclical tightening in structural terms already in place, anyway the SEE-6 fiscal outlook is still facing numerous challenges
- Fiscal rules, embedded within the legislation (Croatia and Serbia)

Source: Country Fiscal Strategies and IMF Country Reports.

Source: Country Fiscal Strategies and IMF Country Reports.

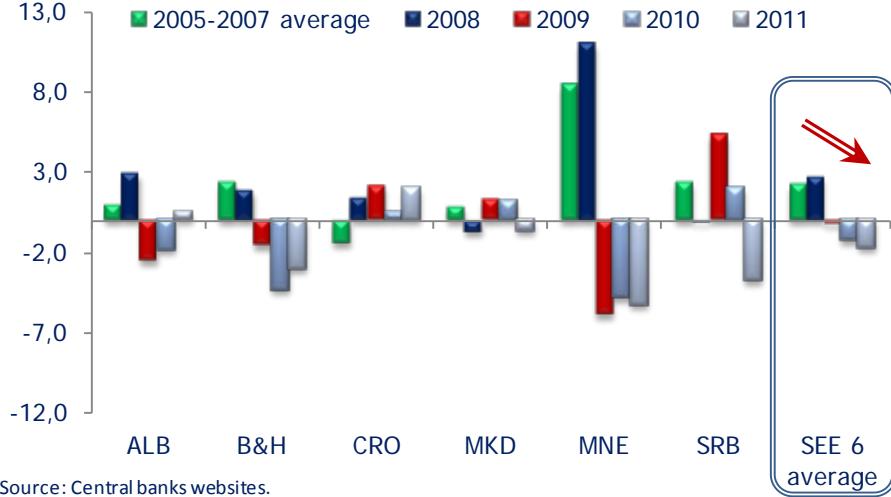

- Buffers in foreign reserves need to be built further, or to be maintained in countries with fixed exchange rate, in order to counter external vulnerability risks – narrowed room for countercyclical monetary policy
- At the current juncture, when inflation pressures in the region are building up, the room for accommodative monetary policy might be limited even in countries with a flexible exchange rate

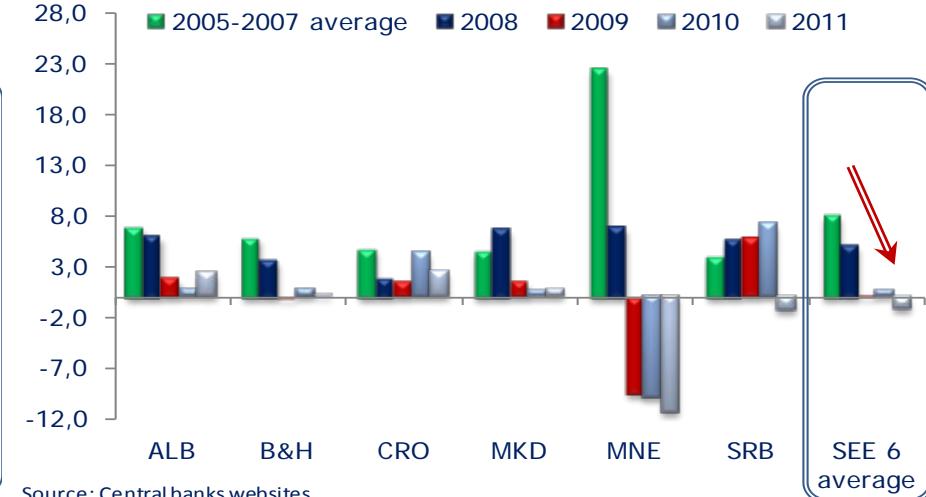

Looking ahead: the role of the domestic banking system at the current juncture

- The role of foreign financing diminishing - more focus on domestic sources
- Most countries have a room for additional financial support of the real economy (anyway credit / deposit ratio decreased from 122 in 2008 to 109 in 2011 for the SEE6)
- The deteriorated portfolio quality and the weak economy constrain a stronger credit growth
- Potential risk to the credit growth: deleveraging of the foreign parent banks could impose additional constraints to subsidiaries in the SEE countries

Foreign liabilities in % of GDP, 12-month change

Credit in % of GDP, 12-month change

Looking ahead: A need for growth enhancing model - dealing with structural rigidities

- Redefining the economic growth model towards more balanced growth - moving away from consumption-based towards investment and export led growth
- Attracting non-debt capital inflows in the tradable sector – increasing competitiveness
- A need for enhanced competitiveness and removing bottlenecks in the investment climate
- Structural reforms necessary for income convergence and EU integration
- Main issues to be addressed: infrastructure enhancement, increase of institutional quality, increase of efficiency and innovations...

Concluding Remarks

- **Growth acceleration – remains as a main challenge for the region;**
- **The fiscal space for countercyclical response is rather limited, expected adjustment for a medium run sustainability;**
- **Constraints on conventional monetary policy, but unconventional measures can be undertaken in a countercyclical manner;**
- **The soundness of the banking system – strength of the region, with existing space for the further banking support for growth;**
- **Enhancing structural reforms, strengthening competitiveness and allocating / attracting capital in tradable sector – a key priority of the region in devising a sustainable new growth model.**
